

POLLINATION PARTY TIME

Some invertebrates eat nectar and/or pollen. Whilst feeding at flowers, they get a dusting of pollen on their bodies, which they take to the next flower. The pollen rubs off and fertilises the flower, which is how seeds are made. Invertebrates that do this are called **pollinators**.

Buzz has been feeding at a flower and has collected some pollen. Help her find her way to the next flower

BUG FAQs

POLLINATION PALS

It's not just bees that pollinate – butterflies, moths, flies and beetles are all important pollinators too!

WANNABE A BEE?

A mask to colour, cut out, and buzz about in...

SIMPLE EYES
3 single lens ocelli, or 'simple eyes', can be found in the middle of a bee's head

MANDIBLES

Bee jaws have many functions, like an insect 'multi-tool'

MISSION MAKE A MASK

COMPOUND EYES

Tiny hexagons make up the bee's complex multi-lens main eyes
